

CH 2: DATABASE USERS

I Database Administrators

- responsible for installation, configuration, securing, managing, monitoring, optimizing the database system
- creates database, manage users, grant permissions, storage management, capacity planning, backup and recovery, create indexes (in collab. with devs)

II Database designers

- designs logical structure of database before the development begins
- they decide tables, attributes, relations, keys, choose normalization, ER diagrams, schema design, define relationships and constraints

III App developers

- build software that interact with databases
- write SQL queries, develop backend APIs, implement CRUD, use ORM, query optimization, handle transactions, integrate database with application

usually use:

JAVA

node.js

django

flask

springboot

.NET

IV Power users

- interact directly with database
- execute complex queries, create reports, perform data analyses

Eg: Finance manager analyzing revenue

V Data Analyst

- extract insight from data to support business decision making
- SQL queries, reports, dashboards, trend analyses, data visualization

uses tools like:

SQL

power BI

tableau

R

python
